

Recruitment Pipeline Analytics

Business Problem Statement & Power BI Solution Overview

1. Background

The Talent Acquisition (TA) team manages recruitment across multiple partner companies and job openings. Applications move through a defined six-stage pipeline: Applied, Screening, Interview 1, Interview 2, Offer, and Hired. While the team collects data at every stage, this data has historically lived in disconnected spreadsheets, making it difficult to see the full picture of pipeline health, where candidates are lost, and how long the hiring process actually takes.

2. Problem Statement

Leadership raised the following concerns during a quarterly review:

- Hiring velocity is inconsistent across departments, but there is no clear visibility into which departments or roles are slow to fill.
- A large share of applicants are rejected, but it is unclear at which stage most candidates are lost — making it hard to target process improvements.
- There is no reliable, single source of truth for total applications, hires, and conversion rate — different stakeholders report different numbers.
- Average time-to-hire is not tracked, so the team cannot benchmark performance or identify slow-moving requisitions.

The TA team requested a self-service, interactive dashboard that consolidates applicant, application, job, company, and stage-level data into a single reliable view — enabling both day-to-day monitoring and root-cause analysis of pipeline drop-off.

3. Objectives

- Provide a single, trusted view of total applications, hires, and conversion rate.
- Visualize the recruitment funnel to identify exactly where candidates drop off.
- Measure average time-to-hire as a core hiring-efficiency metric.
- Compare conversion rate across departments to flag underperforming hiring processes.
- Allow filtering by department, company, and date range so different stakeholders can self-serve their own view.

4. Data Sources

Table	Description
applicants.csv	Candidate profile: name, degree, primary skill, experience, city
applications.csv	One row per application: applicant, job, applied date, current stage, final status
application_stages.csv	Stage history per application, with stage name and stage date
jobs.csv	Job postings: title, department, experience required, status
companies.csv	Company name, industry, and city
